

ABSTRACT

A metal- or resin-integrated gasket, which comprises a cured product layer of a composition comprising (A) an acrylic polymer having at least one alkenyl group capable of undergoing hydrosilylation reaction, (B) a hydrosilyl group-containing compound and (C) a hydrosilylation catalyst as essential components, and a metal plate or a resin plate, the cured product layer being provided on at least one surface of the metal plate or the resin plate. The metal- or resin-integrated gasket has distinguished heat resistance and oil resistance and also a good environmental adaptability without using any organic solvent and thus is used as a suitable gasket for automobile engine cylinder heads, engine oil pans or engine intake-exhaust manifolds.
